Leisure Survey – Reliable information about changes in our daily life

How do you spend your time with your friends or family? Do you play computer games or use social media? Do you take physical exercises? Do you go to festivals or gigs?

Welcome to respond to Statistics Finland's Leisure Survey. Finnish residents' leisure time has changed much and it has not been studied for a long time.

What do you do?

Please respond to the questions on the web form by 21 November 2017. The top right-hand corner of this letter gives the Internet address of the inquiry form and your personal login identifiers for responding to the survey.

The inquiry functions best using a computer, but it is also possible to answer using a mobile device.

Among all Leisure Survey participants, a lot will be drawn for 30 shop vouchers of EUR 50 for S or K group outlets.

Participation is important

Because we cannot invite all people living in Finland to respond, a group representing everybody was selected randomly as participants. **In the survey, you represent your age group and area, and no one else can replace you.**

Your responses are important regardless of how you spend your time or what your interests are. An overall picture can be drawn of changes in people's everyday life only if responses are received from persons of all ages living in different parts of Finland.

Your responses are confidential

The questions are answered without using your name. The statistical data formed from the responses do not contain data from which individual respondents could be identified.

Further information about the survey and researchers' contact details can be found in the accompanying brochure and on the Internet at www.stat.fi/keruu/vap/index_en.html.

Thank you for your co-operation.

*Jussi Heino
Director, Data Collection*

Statistics Finland is a government agency, which produces statistics and conducts surveys describing conditions in society. Data are combined to the data collected in the survey from administrative data available to Statistics Finland, such as family and education data, income and employment data, and demographic variables (age, sex, marital status, regional data). Statistics Finland can release research data for scientific research and statistical surveys. It is not possible to identify persons having participated in the survey from the released data.
